Taiwan Influenza Express

Taiwan Centers for Disease Control | 2008~2009 Influenza Season | Week 13, Mar. 22 ~ Mar. 28, 2009

Taiwan Influenza Surveillance:

1. The consultation rate for ILI (Influenza-Like Illness) reported by sentinel physicians for the week 13 in 2009 was lower than the mean of previous 3 weeks, with the percentage rates for the past 4 weeks being 2.86, 2.64, 2.62, and 2.52, respectively, as shown in Fig. 1. It was 7.0% lower than the mean of previous 3 weeks, which was lower compared to the same period in 2007-2008.
2. Comparing to the mean of previous 3 weeks, the consultation rate decreased in all 6 regions of Taiwan.
3. The dominant influenza virus identified by National Influenza Center and CDC Collaborating Labs in last 6 weeks was type AH1, as shown in Fig. 2.

Conclusion: The influenza surveillance for week 13 indicated that the epidemiological trend in Taiwan was lower than the mean of previous 3 weeks. Influenza AH1 was the dominant viruses in this flu season.

Worldwide Influenza Surveillance:

1. **Asia:** In Hong Kong, the weekly consultation rate for ILI reported by general practitioners for week 12 (2009/3/15-2009/3/21) was 32.9%, which was lower than the previous week and the same period of last year. Since 2009, influenza A was the dominant viruses. In Japan, the number of ILI cases reported by sentinel physicians was 16.50 for week 11 (2009/3/9-2009/3/15), which was higher than the previous week and the same period of last year. Influenza A was the dominant viruses in this flu season.
2. **U.S. /Canada:** In USA, during week 11 (2009/3/15-2009/3/21), influenza activity continued to decrease. The proportion of deaths attributed to pneumonia and influenza was below the epidemic threshold. The proportion of outpatient visits for ILI was above the national baseline. Twenty-four states reported widespread influenza activity, 19 states reported regional influenza activity, 6 states reported local influenza activity, 1 state and the District of Columbia reported sporadic influenza activity. The dominant strain in 2008-2009 was influenza A. In Canada, during week 11 (2009/3/15-2009/3/21), influenza activity remained similar to previous weeks. The ILI consultation rate was higher than previous week (28 ILI consultations per 1,000 patient visits), which is within the expected range for this week. The sentinel response rate was 54%. Of the influenza detections to date, influenza A was the dominant virus.
3. **Europe:** EISS indicated that in week 12 (2009/3/16-2009/3/22) widespread influenza activities were reported in Croatia, Estonia, Netherlands and Ukraine, regional influenza activities were reported in Belarus, Hungary, Latvia, Romania and Russian Federation, local influenza activities were reported in Finland, Greece, Italy, Slovakia, Slovenia and Turkey, sporadic influenza activities were reported in 17 countries and 2 regions, with no activity or no report in the rest countries. The dominant strain in 2008-2009 was influenza A, but influenza B had been progressively increased.
4. **WHO Flu-net:** Global flu surveillance showed that in week 12 (accessed on Apr. 6, 2009) there were widespread outbreaks in Russian Federation, regional outbreaks in Tunisia, Estonia, Belarus, Romania, Greece and USA, local outbreaks in Israel, Latvia, Finland and UK, sporadic outbreaks in Sweden, Denmark, Slovenia, Poland, Switzerland, Portugal, Kazakhstan, Italy, France, Germany, Sri Lanka and China; the rest areas were no activity or no report.

Conclusion: Influenza activity of high intensity is in some countries of Europe, the USA/Canada and Japan.
