Yellow Fever	0	0	0	0	

- The following 8 chronic diseases are excluded from the table: MDR-TB, Tuberculosis, Syphilis, Gonorrhoea, HIV Infection, AIDS, Hansen Disease and Creutzfeldt-Jakob Disease.
- Reported cases.
- The epidemiological week calendar established by the World Health Organization is adopted for calculating each week's cumulative total.
- Since 2014/1/1, "Varicella" was modified to "Complicated Varicella".
- Since 2014/3/6, the case definition for confirmed Acute hepatitis C was changed from "meet the clinical **and** laboratory conditions" to "meet the clinical **or** laboratory conditions".
- Since 2014/7/1, various subtypes of human cases of avian influenza changed to the fifth class of infectious diseases "novel influenza A virus infections". The original "H5N1 flu" and "H7N9 flu" were removed on the same day.

Suspected Clusters

- Sixteen clusters were reported, including 8 tuberculosis clusters, 3 upper respiratory tract infection clusters, 2 diarrhea clusters, 2 influenza-like illness clusters, and 1 varicella cluster.

Imported Infectious Diseases

- 10 confirmed cases were imported from 4 countries during week 6 of 2015.

Disease \ Country	Indonesia	Malaysia	Maldives	Thailand	Total
Dengue Fever	3	1	1	1	6
Amoebiasis	4				4
Total	7	1	1	1	10

Note: The statistics listed in this table include imported cases that were either confirmed or updated* in the previous week.

- A total of 84 confirmed cases were imported from 19 countries in 2015.
- Top 3 imported diseases : Amoebiasis (27), Dengue fever (25), Shigellosis (15).
- Top 3 countries responsible for most imported cases : Indonesia (51), Vietnam (7), Philippines (4).

Summary of Epidemic

- **Influenza** : The influenza activity was high. Since January 1, 2015, a total number of 68 cases of severe complicated influenza have been confirmed, including 56 cases infected by H3N2, 6 cases infected by H1N1, 3 cases infected by untyped influenza A and 3 cases infected by influenza B. Among these cases, 6 deaths were caused by infection with H3N2. Although the numbers of severe complicated influenza cases and emergency visits for influenza-like illness have all increased, they are all lower than those reported during the same period last year. At the moment, H3N2 is the dominant strain circulating in the community. In terms of viral surveillance, approximately 50% of the H3N2 isolates tested in January are considered as low reactors to the currently used influenza vaccine virus. Thus far, no resistant viruses have been detected.
- **Diarrhea** : The ongoing diarrhea outbreak has increased. Children under six years old are the high-risk population for diarrhea. As we have already entered the viral gastroenteritis season, the public is urged to practice good personal hygiene such as washing hands frequently and reminded to avoid eating raw food and consuming unboiled water to ward off infection.
