Taiwan Influenza Express

Taiwan Centers for Disease Control | 2008~2009 Influenza Season | Week 9, Feb. 22 ~ Feb. 28, 2009

Taiwan Influenza Surveillance:

1. The consultation rate for ILI (Influenza-Like Illness) reported by sentinel physicians for the week 9 in 2009 was lower than the mean of previous 3 weeks, with the percentage rates for the past 4 weeks being 4.68, 4.28, 3.54, and 3.22, respectively, as shown in Fig. 1. It was 22.8% lower than the mean of previous 3 weeks, which was lower compared to the same period in 2007-2008.
2. Comparing to the mean of previous 3 weeks, the consultation rate decreased in all 6 regions of Taiwan.
3. The dominant influenza virus identified by National Influenza Center and CDC Collaborating Labs in last 6 weeks was type AH1, as shown in Fig. 2.

Conclusion: The influenza surveillance for week 9 indicated that the epidemiological trend in Taiwan was lower than the mean of previous 3 weeks. Influenza AH1 was the dominant viruses in this flu season. Currently influenza activity in Taiwan is sporadic.

Worldwide Influenza Surveillance:

1. **Asia:** In Hong Kong, the weekly consultation rate for ILI reported by general practitioners for week 8 (2009/2/15-2009/2/21) was 55.3%, which was higher than the previous week but lower than the same period of last year. Since 2009, influenza A was the dominant viruses. In Japan, the number of ILI cases reported by sentinel physicians was 16.75 for week 7 (2009/2/9-2009/2/15), which was lower than the previous week but higher than the same period of last year. Influenza A was the dominant viruses in this flu season.
2. **U.S./Canada:** In USA, during week 7 (2009/2/15-2009/2/21), influenza activity increased slightly. The proportion of deaths attributed to pneumonia and influenza was below the epidemic threshold. The proportion of outpatient visits for ILI was above national and region-specific baseline levels. Twenty-seven states reported widespread influenza activity, 17 states reported regional influenza activity, 6 states and the District of Columbia reported local influenza activity, Puerto Rico reported sporadic influenza activity. The dominant strain in 2008-2009 was influenza A. In Canada, during week 7 (2009/2/15-2009/2/21), an increasing level of influenza activity was reported. The ILI consultation rate was lower than previous week (23 ILI consultations per 1,000 patient visits), which is within the expected range for this week. The sentinel response rate was 57%. Of the influenza detections to date, influenza A was the dominant virus, but influenza B had been progressively increased.
3. **Europe:** EISS indicated that in week 8 (2009/2/16-2009/2/22) widespread influenza activities were reported in Austria, Belgium, Estonia, Hungary, Israel, Italy, Luxembourg, Norway and Switzerland, regional influenza activities were reported in Czech Republic, Finland, France, Germany, Greece, Latvia, Netherlands, Romania and Slovakia, local influenza activities were reported in Albania, Lithuania, Russian Federation, Serbia, Sweden and Ukraine, sporadic influenza activities were reported in 6 countries and 3 regions, with no activity or no report in the rest countries.
4. **WHO Flu-net:** Global flu surveillance showed that in week 8 (accessed on Mar. 9, 2009) there were widespread outbreaks in Slovenia, Switzerland, USA, Norway, Finland, Estonia and Belarus, regional outbreaks in Latvia, France, Germany, Croatia, Romania, Russian Federation and Israel, local outbreaks in Greece, UK and Turkey, sporadic outbreaks in Sri Lanka, Chile, Denmark, Kazakhstan, Italy, Poland, Spain and China; the rest areas were no activity or no report.

Conclusion: Influenza activity of high intensity is in most countries of Europe and the USA/Canada.
