1. The following 8 chronic diseases are excluded from the table: MDR-TB, Tuberculosis, Syphilis, Gonorrhoea, HIV Infection, AIDS, Hansen Disease and Creutzfeldt-Jakob Disease.

2. Reported cases.

3. Since 2014/1/1, "Varicella" was modified to "Complicated Varicella".

4. Since 2014/3/6, the case definition for confirmed Acute hepatitis C was changed from "meet the clinical **and** laboratory conditions" to "meet the clinical **or** laboratory conditions".

5. Since 2014/7/1, various subtypes of human cases of avian influenza are reported as "novel influenza A virus infections", a Category V Notifiable Infectious Disease. The original "H5N1 flu" and "H7N9 flu", which were respectively listed as a Category I Notifiable Infectious Disease and a Category V Notifiable Infectious Disease were removed from the list on the same day.

6. Since 2016/1/22, "Zika Virus Infection" was listed as a Notifiable Infectious Disease.

## Suspected Clusters

- Thirteen clusters were reported, including 5 diarrhea clusters, 4 tuberculosis clusters, 2 upper respiratory tract infection clusters, 1 fever of unknown origin cluster and 1 varicella cluster.

## Imported Infectious Diseases

- 26 confirmed cases were imported from 10 countries during Week 34 of 2016.

Note: The statistics listed in this table include imported cases that were either confirmed or updated\* in the previous week.

- A total of 512 confirmed cases were imported from 36 countries in 2016.
- Top 3 imported diseases : Dengue fever (232), Amoebiasis (89), Hepatitis A (71).
- Top 3 countries responsible for most imported cases : Indonesia (214), Philippines (54), Thailand (51).

## Summary of Epidemic

- Dengue Fever** : The epidemic has increased gradually in South and Southeast Asian countries. Imported cases have continued to be reported. The recent occurrence of intermittent rain has still promoted mosquito growths and elevated the risk of dengue transmission. The public is urged to clean up and remove any vector breeding sites and take prevention measures against mosquito bites.
- Japanese Encephalitis** : Although the epidemic activity is no longer at its peak and has continued to slow down, sporadic cases are still expected to be reported.
- Scrub Typhus** : The number of cases reported has increased slightly, and the epidemic activity remains at its peak. The endemic areas are primarily eastern and outlying islands of Taiwan.

- **Enterovirus** : The epidemic is expected to gradually increase as the new semester starts this week. Coxsackie A virus is currently the dominant strain circulating in the community. Sporadic cases of enterovirus 71 infection have been confirmed recently. This year, a total of 131 cases of enterovirus 71 infection, including 16 severe cases, 111 mild cases and 4 suspected severe cases, have been confirmed. The public is urged to enhance personal hygiene and stay vigilant for suspicious symptoms of enterovirus infection with severe complications in infants.
