

Application of Next-Generation Sequencing in Public Health —Analysis of NDM-5-Carrying Bacteria, 2014–2017

Yu-Chi Lin¹, Hsin-Yi Wei², Hsiao-Jung Chen¹, Jung-Jung Mu^{1*}

Abstract

Next-Generation Sequencing(NGS) has the advantage of high throughput sequence capacity which provides information on unlimited pathogen targets, resistance genes, as well as outbreak surveillance. In this study, we applied NGS for epidemiological surveillance on the bacterial antimicrobial resistance. From 2014 to 2017, 8 carbapenem-resistant *Enterobacteriaceae* (CRE) isolates carrying NDM-5 were identified and originated from 2 hospitals in northern Taiwan (HH and TH) and 1 from a hospital in southern Taiwan (CH), respectively. Among them, 5 isolates from HH hospital had high similarity in PFGE phylogenetic analysis, similar plasmid replicon type and size and identical NDM-5-containing contigs. Taken together, these 5 isolates were considered as epidemiologically related strains. Two isolates from TH hospital had lower similarity in PFGE phylogenetic analysis, differences in plasmid types and size. However, the NDM-5-containing contigs were identical, presumably due to the insertion sequence IS26 which is responsible to transmission of the antimicrobial-resistance genes. As of the isolate from CH hospital, the sequence of its NDM-5-containing plasmid was similar to the internationally epidemic NDM-5 plasmid,

indicating that the plasmid might be imported. This study shares the vision on the use of NGS to provide the CRE antimicrobial-resistance information and benefit the epidemiological surveillance in the future. We recommended that CRE in Taiwan should be monitor continuously to follow the distribution and trends of antimicrobial resistant bacteria.

Evaluation of Immunochromatographic Rapid Test for Norovirus

Tsung-Ting Hsieh, Shu-Chun Chiu, Wan-Ting Liao,
Chih-Tung Lu, Ting-Yo Kuo, Jih-Hui Lin*

Abstract

Noroviruses are the major viral pathogen in domestic diarrhea outbreaks. About 40% of the diarrhea outbreaks were attributed to norovirus infection. Because of its high infectiousness, a rapid and accurate detection method is key to the control of norovirus outbreaks. In this study, we randomly selected 101 fecal samples from 21 diarrhea outbreaks from January to June 2018 to evaluate the sensitivity and specificity of RIDA® QUICK Norovirus test. The sensitivity of the rapid test was 67.2%, and the specificity was 100%. Positive test results confirm the existence of norovirus in fecal samples, but negative test results still need to be further confirmed by the real-time RT-PCR as the gold standard. Therefore, rapid tests provide a quick preliminary screening, but still cannot replace real-time RT-PCR in laboratories. In order to avoid false negative results that lead to the expansion of the epidemic, submitting the specimens to the laboratory for further confirmation as soon as possible is still necessary.

Keywords: Norovirus, rapid test reagent, real-time RT-PCR

1. ★The weekly and cumulative total numbers include indigenous and imported cases of notifiable infectious diseases.
 2. MDR-TB, Tuberculosis, Syphilis, Gonorrhoea, HIV Infection, AIDS, Hansen's Disease and Creutzfeldt-Jakob Disease are excluded from the table.
 3. Numbers of mumps and tetanus cases are summed up by the week of report.
 4. Since 2018/1/1, "Listeriosis" was listed as a Notifiable Infectious Disease.

Suspected Clusters

- Fifty clusters were reported during week 40, including 8 tuberculosis clusters, 15 diarrhea clusters, 10 upper respiratory tract infection clusters, 13 influenza-like illness clusters, 2 varicella clusters, and 2 enterovirus clusters.

Imported Infectious Diseases

- There were 27 imported cases from 9 countries during week 40 of 2019.

Countries \ Diseases	Indonesia	Philippines	Vietnam	Myanmar	Singapore	Cambodia	Thailand	Papua New Guinea	Canada	Total
Amoebiasis	7	2					1			10
Dengue Fever	1	2	3		2	1				9
Chikungunya Fever				2			1			3
Typhoid fever	1	1								2
Malaria								1		1
Measles						1				1
Acute Hepatitis A									1	1
Total	9	5	3	2	2	2	2	1	1	27

Note: The table summarized the number of imported cases that were either **confirmed** or **updated** in the given week.

- There are 835 imported cases from 38 different countries in 2019. The top 3 countries are Indonesia (233), Vietnam (123), and the Philippines (104).
- Top 3 imported diseases are Dengue Fever (417), Amoebiasis (138), and Chikungunya Fever (75).

Summary of Epidemic

- **Enterovirus** : The epidemic has gradually slowed down, but it is still in the epidemic period. EV71 is still circulating in the community.
- **Dengue and Chikungunya** : Because of the recent rainfall in Northern Taiwan, and the potential overseas travel on the coming holidays, the risk of epidemic is persistence.

3. Numbers of mumps and tetanus cases are summed up by the week of report.
4. Since 2018/1/1, "Listeriosis" was listed as a Notifiable Infectious Disease.

Suspected Clusters

- Thirty-seven clusters were reported during week 41, including 5 tuberculosis clusters, 12 diarrhea clusters, 5 upper respiratory tract infection clusters, 13 influenza-like illness clusters, and 2 varicella clusters.

Imported Infectious Diseases

- There were 14 imported cases from 7 countries during week 41 of 2019.

Diseases \ Countries	Vietnam	Philippines	Cambodia	Myanmar	Thailand	Indonesia	Japan	Total
Dengue Fever	4	2	3	1	1			11
Amoebiasis		1				1		2
Severe Complicated Influenza							1	1
Total	4	3	3	1	1	1	1	14

Note: The table summarized the number of imported cases that were either **confirmed** or **updated** in the given week.

- There are 849 imported cases from 38 different countries in 2019. The top 3 countries are Indonesia (234), Vietnam (127), and the Philippines (107).
- Top 3 imported diseases are Dengue Fever (428), Amoebiasis (140), and Chikungunya Fever (75).

Summary of Epidemic

- **Enterovirus** : The epidemic has gradually slowed down, but it is still in the epidemic period. EV71 is still circulating in the community.
- **Dengue** : There is a new indigenous cluster in Shulin District, New Taipei City, and there are new indigenous cases in Taichung and Tainan City; the risk of epidemic is persistence.

The Taiwan Epidemiology Bulletin series of publications is published by Centers for Disease Control, Ministry of Health and Welfare, Taiwan (R.O.C.) since Dec. 15, 1984.
