Taiwan Influenza Express

Taiwan Centers for Disease Control | 2008-2009 Influenza Season | Week: 3 (1/11-1/17), 2009

Taiwan Influenza Surveillance:

1. The consultation rate for ILI (Influenza-Like Illness) reported by sentinel physicians for the week 3 in 2009 was higher than the mean of previous 3 weeks, with the percentage rates for the past 4 weeks being 3.19、3.36、3.69、4.02, respectively, as shown in Fig. 1. It was higher than the mean of previous 3 weeks by 17.6%, which was the same compared to the same period in 2007-2008.
2. Comparing to the mean of previous 3 weeks, the consultation rate increased in all 6 regions of Taiwan.
3. The dominant influenza virus identified by National Influenza Center and CDC Collaborating Labs in last 6 weeks was type AH3, as shown in Fig. 2.

Conclusion: The influenza surveillance for week 3 indicated that the epidemiological trends in Taiwan were higher than the mean of previous 3 weeks. Influenza AH3 was the dominant viruses in this flu season. In last 6 weeks, AH3 was the dominant type, but the isolation of AH1 has increased progressively. Currently influenza activity in Taiwan is local.

Worldwide Influenza Surveillance:

1. **Asia:** In Hong Kong, the weekly consultation rate for ILI reported by general practitioners for week 2 (2009/1/4-2009/1/10) was 35.9%, which was higher than the previous week and lower than the same period of last year. Since 2008, influenza A was the dominant viruses. In Japan, the number of ILI cases reported by sentinel physicians was 11.94 for week 2 (2009/1/5-2009/1/11), which was higher than the previous week and the same period of last year. Influenza A was the dominant viruses in this flu season.
2. **U.S./Canada:** In USA, during week 1 (2009/1/4-2009/1/10), a low level of influenza activity was reported. The proportion of deaths attributed to pneumonia and influenza was below the epidemic threshold. The proportion of outpatient visits for ILI was below national and region-specific baseline levels. One state reported widespread influenza activity, 5 states reported regional influenza activity and 10 states reported local influenza activity; the District of Columbia, Puerto Rico and 33 states reported sporadic influenza activity. The dominant strain in 2008-2009 was influenza A. In Canada, during week 1 (2009/1/4-2009/1/10), low levels of influenza activity was reported. The ILI consultation rate was slightly lower than previous week (18 ILI consultations per 1,000 patient visits), which is below the expected range for this week. The sentinel response rate was 64%. Of the influenza detections to date, 54% were influenza A and 46% were influenza B.
3. **Europe:** EISS indicated that in week 2(2009/1/5-2009/1/11) widespread influenza activity was reported in Belgium, Denmark, England, France, Ireland, Italy, Luxembourg, Netherlands, Northern Ireland, Norway, Slovenia, Spain, Sweden and Switzerland, regional influenza activities was reported in Austria, Germany and Wales, local influenza activities was reported in Czech Republic and Estonia, sporadic influenza activities was reported in 5 countries and one region, with no activity or no report in the rest countries.
4. **WHO Flu-net:** Global flu surveillance showed that in week 52 (accessed on Jan 23, 2009) there were widespread outbreak in Portugal and Denmark, regional outbreak in France, Japan, Luxembourg and Spain, local outbreak in Netherlands, Norway, Finland and USA, sporadic in 16 countries; the rest areas were no activity or no report.

Conclusion: Influenza activity of high intensity is in most countries in Europe.
