

Summary

According to the laboratory surveillance¹, Coxsackie A was the predominant virus type in the past four weeks in community (Figure 1). During week 17, the total number of outpatient and emergency room (ER) visits for enterovirus infection was 13,929, which was increasing recently and above the threshold (11,000 visits), as shown in Figure 2. Between April 23 and 29, no new EVSC² case was confirmed. There has been one case of EVSC since 2024 caused by Coxsackie A10 (Figure 3 and 4, Table).
