Taiwan CDC

2023-2024 Influenza Season

Week 5, Jan 28, - Feb 3, 2024

Synopsis

The number of outpatient and emergency room (ER) visits of influenza-like illness (ILI) was higher than the previous week, and the epidemic remained in a plateau phase. In the community, the predominant influenza strain is A/H3N2. The number of influenza cases with severe complications continues to be high, and the risk of severe illness should be noted.

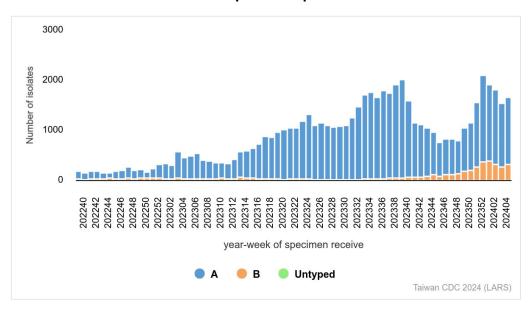

- The number of outpatient and ER visits of ILI was higher than the previous week, but was below the numbers of week 2-3 this year. The epidemic remained in a plateau phase.
- During the last four weeks, A/H3N2 has been the predominant influenza strain circulating in the community, followed by influenza B.
- During 2023-2024 influenza season (since October 1, 2023), there have been 435 influenza cases with severe complications, of which 71 cases were fatal.

Laboratory Surveillance¹

Laboratory Automated Reporting System (LARS)

The number of influenza-positive specimens has shown a decreasing trend recently, however, the number remains high. Over the last four weeks, the proportion of influenza A positive specimens was 82%, and the proportion of influenza B was 18%. Data are available at https://nidss.cdc.gov.tw/.

Numbers of influenza-positive specimens from LARS

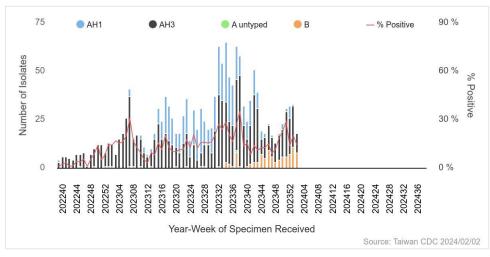

¹ In terms of the surveillance systems in Taiwan, please see: Jian, S. W., Chen, C. M., Lee, C. Y., & Liu, D. P. (2017). Real-Time Surveillance of Infectious Diseases: Taiwan's Experience. Health security, 15(2), 144-153.

Contracted Virology Laboratories Surveillance

During week 52, 2023 to week 3, 2024, the predominant isolated influenza virus was A/H3N2 (64.0%), followed by influenza B (28.1%) and A/H1N1 (7.9%). Data are available at https://nidss.cdc.gov.tw/.

Antigenicity

During the 2023-2024 influenza season (since Oct 1, 2023), 73 of 75 influenza A/H1N1 viruses (97.3%) were antigenically similar to the vaccine reference strain A/Victoria/4897/2022 (H1N1)pdm09, 216 of 219 influenza A/H3N2 viruses (98.6%) were antigenically similar to the vaccine reference strain A/Darwin/9/2021 (H3N2), and 47 of 47 influenza B/Victoria viruses (100%) were antigenically similar to the vaccine reference strain B/Austria/1359417/2021 (B/Victoria lineage).

WHO recommended vaccine strains for the northern hemisphere in the 2023-2024 influenza season	Vaccine-like (%)	Low reactor (%)
A/Victoria/4897/2022 (H1N1)pdm09-like virus	73 (97.3%)	2 (2.7%)
A/Darwin/9/2021 (H3N2)-like virus	216 (98.6%)	3 (1.4%)
B/Austria/1359417/2021 (B/Victoria lineage)-like virus	47 (100%)	0 (0.0%)

Note: The hemagglutination inhibition (HI) method was used to investigate the antigenicity, and the titer of the isolated virus was at least 8-fold lower than that of the reference virus, identifying it as a low reactor.

Antiviral Resistance

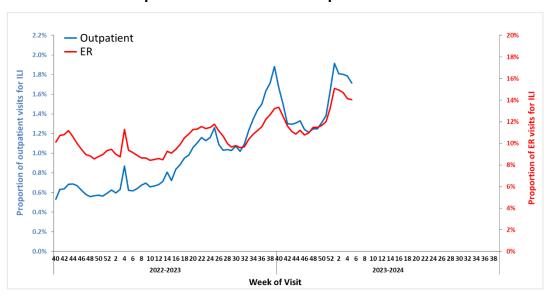

The table below summarizes the antiviral resistance to neuraminidase inhibitor (Oseltamivir) of the isolates during the 2023-2024 influenza season.

	No. of isolates tested	Resistance Viruses, n (%)
A (H1N1)	70	0 (0%)
A (H3N2)	216 0 (0%)	
В	49	0 (0%)

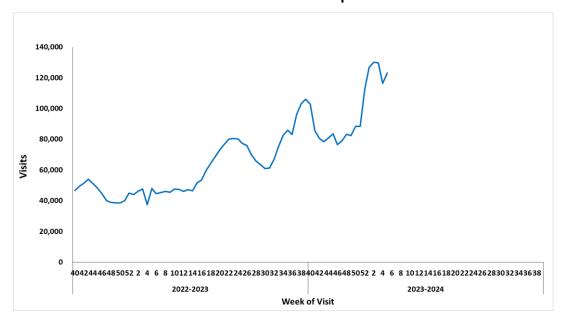

Influenza-like Illness (ILI) Surveillance

During week 5, the proportions of ILI visits were 1.7% in outpatient and 14.0% in the ER, with the latter percentage remaining above the threshold of 11.0%. The total number of visits was 123,131, which was higher than the previous week, but it was below the numbers of week 2-3 this year. The epidemic remained in a plateau phase. Data are available at https://nidss.cdc.gov.tw/.

Total number of ILI visits in outpatient and ER

Influenza Case with Severe Complications

There were 30 newly confirmed influenza cases with severe complications (3 of H1N1, 23 of H3N2, 2 of untyped influenza A, and 2 of influenza B), and 8 fatal cases (1 of H1N1, 6 of H3N2, and 1 of influenza B). During 2023-2024 influenza season, a total of 435 influenza cases with severe complications (133 of H1N1, 269 of H3N2, 7 of untyped influenza A, and 26 of influenza B) were confirmed, of which 71 cases were fatal (26 of H1N1, 40 of H3N2, 2 of untyped influenza A, and 3 of influenza B).

Notification trend of confirmed influenza cases with severe complications

Data are available at https://nidss.cdc.gov.tw/.

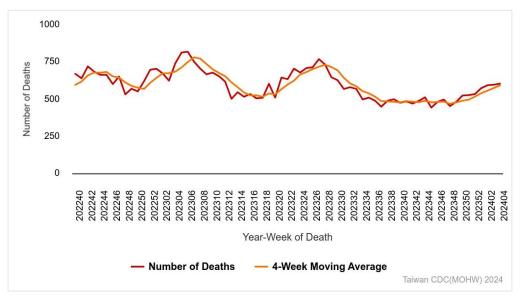

Incidence of influenza cases with severe complications and mortality rate during 2023-2024 influenza season

Age Group	Cases	Deaths	Cumulative incidence per 100,000 population	Cumulative mortality per 100,000 population
< 3 y	3	1	0.68	0.23
3-6 y	7	1	0.94	0.13
7-18 y	24	1	0.98	0.04
19-24 y	3	1	0.19	0.06
25-49 y	66	7	0.76	0.08
50-64 y	80	13	1.51	0.25
65 +	252	47	6.02	1.12
Total	435	71	1.86	0.30

Pneumonia and Influenza (P&I) Mortality Surveillance

Based on the Internet System for Death Reporting (ISDR)² data, the number of deaths attributed to pneumonia and influenza (P&I) has increased recently. The proportion of deaths attributed to P&I for adults aged 65 and older was the highest among the three age groups (0-49, 50-64, and 65+). Weekly data are available at https://nidss.cdc.gov.tw/.

Weekly Number of Deaths due to Pneumonia and Influenza

² Medical institutions are required to report any mortality case to the Ministry of Health and Welfare (MOHW) within 7 days after a death certificate is issued through the Internet System for Death Reporting (ISDR). Either the immediate cause of death or the underlying cause of death was used to identify P&I death cases. Only those with keyword texts containing 'pneumonia', 'influenza' or 'common cold' were counted as a P&I death.
