

Summary

According to the laboratory surveillance¹, Coxsackie A was the predominant virus type in the past four weeks (Figure 1), and EV71 and EV-D68 virus were active in community. During week 21, the total number of outpatient and ER visits for enterovirus infection was 12,924, which was increasing in recent weeks and was above the threshold (11,000 visits), as shown in Figure 2.

Between May 23 and 29, no new EVSC² case was confirmed. There have been three EVSC cases since 2023 (Figure 3), and cases caused by EV-D68, Coxsackie A6, and Echovirus 21, respectively (Figure 3). All cases were below 5 years old (Table 1).
