

### Summary

According to the laboratory surveillance<sup>1</sup>, Coxsackie A was the predominant virus type in the past four weeks in community (Figure 1). During week 18, the total number of outpatient and emergency room (ER) visits for enterovirus infection was 16,240, which was increasing recently and above the threshold (11,000 visits), as shown in Figure 2. Between April 30 and May 6, no new EVSC<sup>2</sup> case was confirmed. There has been one case of EVSC since 2024 caused by Coxsackie A10 (Figure 3 and 4, Table).
