## Summary

According to the laboratory surveillance ${ }^{1}$ ，Coxsackie A was the predominant virus type in the past four weeks（Figure 1），EV71 and EV－D68 virus were active in community． As some outpatient services closed for a national holiday during week 39，the total number of outpatient and ER visits for enterovirus infection was 12，262，which was lower than last week but still above the threshold（ 11,000 visits），as shown in Figure 2. Between September 26 and October 2，no new EVSC ${ }^{2}$ case was confirmed．There have been ten EVSC cases（including one death）since 2023 （Figure 3），and these cases caused by Coxsackie A4，A6，EV－D68，and Echovirus 21（Figure 3）．All cases were below 5 years old（Table 1）．

Table 1．Age and sex distribution of EVSC cases in 2023

| Age（year） | Male | Female | Total |
| :---: | :---: | :---: | :---: |
| ＜1 | 2 | 1 | 3 |
| 1 | 2 | 2 | 4 |
| 2 | 2 | 0 | 2 |
| 3 | 0 | 0 | 0 |
| 4 | 0 | 1 | 1 |
| 5 | 0 | 0 | 0 |
| 6 | 0 | 0 | 0 |
| 7－9 | 0 | 0 | 0 |
| $\geqq 10$ | 0 | 0 | 0 |
| Total | 6 | 4 | 10 |
|  |  |  |  |
