

## Summary

According to the laboratory surveillance<sup>1</sup>, Coxsackie A was the predominant virus type in the past four weeks (Figure 1), and EV71 and EV-D68 virus were active in community. During week 31, the total number of outpatient and ER visits for enterovirus infection was 8,406, which was lower than the threshold (11,000 visits) and showed a downward trend recently, as shown in Figure 2.

Between August 1 and 7, no new EVSC<sup>2</sup> case was confirmed. There have been eight EVSC cases since 2023 (Figure 3), and cases caused by Coxsackie A4, A6, EV-D68, and Echovirus 21 (Figure 3). All cases were below 5 years old (Table 1).
