## Summary

According to the Taiwan Virological Surveillance ${ }^{1}$ ，the majority of isolated virus type was echovirus 11 （ECHO 11）in the past 4 weeks（Figure 1）．However，the cases with EV71 infection were increasing．During week 29，a total number of outpatient department and ER visits for enterovirus infection were 10，152，which was lower than the previous week． The number of medical visits are declining in the past few weeks and below the national baseline（Figure 2）．

In Week 29，no new enterovirus infection with severe complications（EVSC）case was confirmed．Therefore，the total number remains the same at 20 cases（Figure 3），including six deaths due to ECHO 11 infection．These EVSC cases were infected with Coxsackie A4， A9，A16，Coxsackie B1，B2，B3，EV71，ECHO 11，and both EV71 and Coxsackie A16．In addition， $45 \%$ of the cases were less than or equal to 1 month old（Table 1）．Figure 4 shows the geographical distribution of EVSC cases according to their residential areas．

Table 1．Age and sex distribution of EVSC cases in 2018

| Age（year） | Male | Female | Total |
| :---: | :---: | :---: | :---: |
| $\leq 1$ month | 5 | 4 | 9 |
| $1-12$ month | 1 | 0 | 1 |
| 1 | 2 | 0 | 2 |
| 2 | 1 | 1 | 2 |
| 3 | 2 | 1 | 3 |
| 4 | 0 | 2 | 2 |
| 5 | 1 | 0 | 1 |
| 6 | 0 | 0 | 0 |
| $7-9$ | 0 | 0 | 0 |
| $\geqq 10$ | 0 | 0 | 0 |
| Total | 12 | 8 | 20 |
|  |  |  |  |
|  |  |  |  |
